GR-012 Human Operating Readiness Instrument v0.2

Evidence-backed readiness for the human-AI operating relationship

Working position

Keep GR-012. Refine it; do not rethink it. The instrument should prove that human responsibility is operationally real - not merely present on a diagram - before a work transition is treated as ready.

Prepared by GiGi Garcia for joint review with Timothy King
October 28, 2026

Status: DRAFT - for pressure testing and design agreement; not yet framework-wide policy

1. Executive Summary

GR-012 answers a specific question that the work-side architecture cannot answer by itself: **can the people and organization actually operate the proposed human-AI relationship?** It is not a generic AI-readiness survey, a sentiment measure, or a technical validation instrument.

> **Core question**
>
> Can the organization operate this proposed human-AI relationship with real authority, capability, evidence, capacity, and escalation?

v0.2 keeps the ten-dimension instrument, makes its layers explicit, strengthens the evidence rules, keeps Gray/Insufficient Evidence legitimate, and preserves the decision not to collapse readiness into one composite score. It also incorporates the current work-side proposals on Human Intensity, weakest-link behavior, the top-of-catalog governance variant, and Human Criticality - with the refinements documented below.

Item	Current status	v0.2 direction
GR-012 wording	Adopted direction	Each dimension produces a finding with evidence; no unexplained composite score.
HRBP Manager / grievance	First pass complete	Outcome: Insufficient Evidence. Gray remained Gray where organization-specific proof was missing.
Recruiter	Next human-readiness pilot	Run the same ten dimensions without redefining them.
CHRO	Third human-readiness pilot	Use the same instrument and test the executive/top-of-catalog case.
Hard gates	Candidate only	Do not lock until the same instrument has been run across all three roles.
GR-013 Human Agency	Direction settled, final integration pending	Keep distinct as a derived human-impact finding; do not add an 11th readiness score/dimension.

2. Purpose and Unit of Assessment

GR-012 must be applied to a specific proposed transition in the Working Relationship. It should never ask a broad question such as “Is HR ready for AI?” The unit is one activity/transition, with the work-side facts handed into Human Impact & Readiness.

> **Example assessment unit**
>
> Activity: Manage employee grievances. Current relationship: assessed state. Proposed relationship: the next intended working relationship, never beyond the Progression Ceiling. Readiness question: what must be true of the affected role(s) and organization for that specific transition to operate responsibly in practice?

3. The Ten Readiness Dimensions - Same Instrument, Clearer Architecture

v0.2 keeps all ten dimensions. The change is architectural: users should be able to see whether a question tests a role/human operating condition, an organizational operating condition, or the shared evidence boundary.

Role / Human Operating Conditions	Organizational Operating Conditions
Role Clarity	Manager / Governance-Oversight Readiness
Decision Authority	Leadership Support / Governance
Capability / Skill	Change Capacity
Confidence / Decision Fluency	
Psychological Safety	
Capacity / Workload	

Shared evidence condition - Trust / Evidence Quality. Technical evidence comes from the technical/process lane. GR-012 does not re-run technical validation; it tests whether the human side can see enough of the evidence, understand its limits and failure modes, and rely on it appropriately.

4. Dimension Definitions and Evidence Questions

Dimension	Readiness question	Evidence to look for
Role Clarity	Does the person understand what AI is allowed to do, what stays human, what must be reviewed/decided, and what cannot be delegated?	Workflow, role language, RACI, training, scenario walkthrough.
Decision Authority	When the person believes the AI-supported result is wrong, what are they actually allowed to do?	Override rights, system permissions, escalation process, approval matrix, governed decision points.
Capability / Skill	Does the person have enough domain expertise and judgment to evaluate the AI-supported work independently?	Case review, scenario testing, qualifications, exception-handling evidence.
Confidence / Decision Fluency	If the person and system disagree, will the person make and defend an independent decision?	Scenario exercises, observed override behavior, manager feedback.
Psychological Safety	Can the person challenge the system and act on that concern without unreasonable personal or professional risk?	Speak-up history, leadership behavior, escalation norms, incident reviews.
Capacity / Workload	Does the new relationship leave enough real capacity for meaningful review,	Caseload, review time, exception volume, backlog, staffing, verification

Dimension	Readiness question	Evidence to look for
	exception handling and escalation?	effort.
Manager / Governance-Oversight Readiness	Is the surrounding manager or governance body prepared to coach, challenge, absorb escalation and govern the redesigned relationship?	Manager/governance expectations, escalation criteria, monitoring, coaching, evidence of the actual oversight body.
Leadership Support / Governance	Who owns the outcome and what happens when the new relationship fails?	Decision rights, risk tolerance, stop conditions, escalation routes, named owners, governance standards.
Trust / Evidence Quality	What evidence justifies asking the person to rely on the system at this level?	Traceable technical evidence: type, source, reference, confidence, limitations, failure modes, real-volume results.
Change Capacity	Even if the transition is right, can the organization absorb it now?	Competing initiatives, staffing changes, implementation timing, leadership capacity, change load.

5. Finding States and Evidence Rule

Finding	Meaning	Evidence rule
Ready	The condition is in place and supported by evidence.	Evidence demonstrates the operating condition exists in practice.
Conditional	The transition may proceed only if a named condition, gap or control is resolved.	Requires actual evidence of a gap or condition; a modeled concern alone is not enough.
Not Ready	A material condition prevents responsible progression right now.	Evidence shows a real stop condition or unacceptable operating gap.
Insufficient Evidence	There is not enough organization-specific evidence to make a defensible readiness conclusion.	Unknown stays unknown. This is not failure and is not “Not Ready.”

Non-negotiable evidence rule

Gray / Insufficient Evidence may not be converted into Ready, Conditional or Not Ready based only on reference-model assumptions, modeled concerns, or intuition. A finding changes only when organization-specific evidence supports the change.

6. Standard Assessment Record

Every dimension should leave the same auditable record. The framework should never store only a color, status or score.

Field	What gets recorded
Activity / transition	Specific activity; assessed Current State; proposed next relationship; Progression Ceiling.
Roles affected	Responsible role(s), Accountable role, manager/governance/escalation path where relevant.
Dimension finding	Ready / Conditional / Not Ready / Insufficient Evidence.
Evidence	What is actually known, including Assessed vs. Modeled status.
Evidence provenance	Evidence type, source role, reference, confidence, coverage, evidence date.
Gap / concern	What is missing, uncertain, or evidenced as a problem.
Required action / control	What must happen before progression or what condition must be maintained.
Owner	Role accountable for closing the gap or maintaining the control.
What would move this finding	Specific evidence or operating change that would justify a different finding.
Version / timing	Assessment date, reference-model version, and review trigger.

7. Candidate Hard Gates - Do Not Lock Yet

The first draft identified six dimensions that may behave like hard gates. v0.2 keeps them as a hypothesis until the same instrument is run across HRBP Manager, Recruiter and CHRO.

- Decision Authority
- Capability / Skill
- Psychological Safety
- Capacity / Workload
- Leadership Support / Governance
- Trust / Evidence Quality

Gate test: Did failure of this condition actually make the proposed human-AI relationship unsafe, non-credible, or impossible to operate responsibly? If the answer is not consistently yes across relevant pilots, the dimension should remain diagnostic/conditional rather than universal hard gate.

8. v0.2 Decisions on the Four Work-Side Proposals

8.1 Human Intensity - qualitative finding, not a proxy score

Human Intensity remains a qualitative Human Impact & Readiness finding in v0.2. The work-side High/Critical share of work remaining with the person is useful evidence, but it is not the definition of intensity and should not be treated as a proxy for cognitive, emotional, relational or operational burden.

> **Human Intensity question**
>
> Does AI truly reduce human burden, or does it remove routine/easier work and concentrate the hardest cognitive, emotional, relational or operational work in the human?

8.2 Weakest-link behavior - material operational roles only

For High or Critical activities, readiness should roll up no stronger than the weakest materially required operational A/R role. Multiple roles should not be averaged into a reassuring composite. Low/Moderate activities can retain role-specific findings without a mandatory roll-up.

For a single decision-maker, the manager, executive committee or board should not automatically become another role in the same weakest-link calculation. That relationship is assessed separately as Manager / Governance-Oversight Readiness unless the body itself has an operational RACI responsibility for the activity.

8.3 Manager Absorption - top-of-catalog governance variant

Where a role has no manager above it in the role catalog, the framework should not display “no data.” Use a named Governance/Oversight Body variant. The actual body - board, executive committee or other governance structure - must be evidenced for the organization rather than assumed.

8.4 Human Criticality - interpret existing Consequence of Error evidence

Do not create a competing Human Criticality score. Use the existing Consequence of Error evidence - particularly Human Impact, Reach and Reversibility - as the work-side evidence base, then interpret what that consequence means for the human retaining the decision/control element.

Human Criticality should also be able to surface downstream human consequences even when the primary Consequence of Error factor is legal, operational or trust-related.

9. GR-013 Human Agency / Meaningful Human Control

> **Definition**
>
> Human Agency / Meaningful Human Control is whether a person can actually exercise the judgment and accountability the operating model assigns to them, including the practical ability to understand, question, challenge, override, pause and escalate AI-supported work when appropriate.

Human Agency remains a distinct construct because “human present” is not the same as “human in meaningful control.” However, it should not become an eleventh GR-012 dimension or another readiness score. It should be a derived human-impact finding informed especially by Decision Authority, Capability/Skill, Confidence/Decision Fluency, Psychological Safety, Capacity/Workload, and usable Evidence Quality.

For executive/top-of-catalog roles, the agency question may shift. The issue may be less “can I override AI?” and more “do I have sufficiently trustworthy evidence, independent judgment and governance challenge to decide well?”

10. Narrative Conclusion - No Composite Readiness Percentage

Each completed GR-012 assessment should end with a short narrative conclusion rather than a 0-100 score. The conclusion must show the outcome, the evidence behind it, the principal gaps, and what must happen before progression.

> **Narrative template**
>
> [Role / activity] is [Ready / Conditional / Not Ready / Insufficient Evidence] for the proposed transition. The strongest operating conditions are ____. The principal unresolved conditions are ____. The available evidence shows ____. Before progression, the organization must ____. Human Agency is [supported / constrained / not yet evidenced] because ____.

11. Pilot Sequence and Pressure-Test Plan

The same ten dimensions must be used without adding, dropping or redefining a dimension between pilots. The success condition is not identical findings across roles. The success condition is a stable method that produces credible, role-specific findings.

11.1 Pilot 1 - HRBP Manager / Manage employee grievances

Status: first pass complete. The instrument correctly produced Insufficient Evidence where organization-specific proof was missing. The pilot should remain the baseline example for Gray/unknown discipline and for separating organization findings from instrument-design findings.

11.2 Pilot 2 - Recruiter / 7.2.3.4 Select and reject candidates

Purpose: pressure-test the same instrument on Critical, higher-volume operational work and test weakest-link behavior without changing the ten dimensions.

Dimension	Recruiter pressure-test question
Role Clarity	Does Recruiter know exactly what AI may do in sourcing/screening/ranking versus what remains the human select/reject decision?
Decision Authority	Can Recruiter reject, override, pause or challenge an AI ranking/recommendation?
Capability / Skill	Can Recruiter detect biased, incomplete, weak or misleading AI-supported candidate recommendations?
Confidence / Decision Fluency	Will Recruiter challenge a confident-looking AI recommendation when independent judgment differs?
Psychological Safety	Can Recruiter slow, stop or challenge the process without pressure to accept AI output for speed or volume?
Capacity / Workload	Is there enough real time to review the harder cases that remain after AI absorbs more routine work?
Manager / Governance-Oversight Readiness	Is Director of TA prepared to support, govern and absorb escalations under the new operating model?

Dimension	Recruiter pressure-test question
Leadership Support / Governance	Are hiring decision rights, escalation rules, controls and accountability operationally defined?
Trust / Evidence Quality	Can Recruiter see enough traceable evidence, limitations and failure modes to rely appropriately on AI-supported screening/ranking?
Change Capacity	Can recruiting absorb the new workflow, capability requirements and escalation model at real operating volume?

Pilot rule: Where organization-specific evidence is unavailable, record Insufficient Evidence and explicitly state what would move the finding. Do not infer readiness from the reference model.

11.3 Pilot 3 - CHRO / 7.1.1.2 Define HR and business function roles and accountability

Purpose: test whether the same instrument holds at executive level, where authority, governance and organizational consequence are shaped differently and there is no traditional manager-above relationship inside the role catalog.

- Use the same ten dimensions with no redefinition.
- Use the Governance/Oversight Body variant instead of treating top-of-catalog as “no data.”
- Test whether the relevant governance body is evidenced rather than assumed.
- Pay special attention to Decision Authority, Leadership/Governance, Evidence Quality, Change Capacity and the executive form of Human Agency.
- End with the same narrative conclusion format used for HRBP Manager and Recruiter.

12. Decisions to Make Only After the Three Pilots

Decision	Question the pilots must answer
Hard gates	Which dimensions repeatedly behaved as true stop conditions rather than remediable diagnostics?
Weakest-link rule	Did the rule protect High/Critical work without over-penalizing roles that were not materially required?
Executive exception	Did the Governance/Oversight Body variant work for CHRO and other top-of-catalog cases?
Human Agency	Did the derived GR-013 finding add information beyond the ten dimensions without duplicating them?
Human Intensity	Did qualitative findings reveal burden that the High/Critical share could not explain on its own?
Evidence schema	Were evidence type, source role, reference, confidence, date and coverage sufficient to move findings defensibly?
Instrument stability	Did the same ten dimensions hold without redefinition across Managerial, Operational and Executive roles?

13. Design Guardrails

- Do not turn the ten dimensions into one readiness percentage.
- Do not treat Insufficient Evidence as failure or as Not Ready.
- Do not turn Modeled potential into an observed readiness finding.
- Do not re-run technical validation inside GR-012; consume technical evidence with provenance.
- Do not average materially different role-level findings into one reassuring number.
- Do not treat a governance body as an operational touching role unless it actually holds operational responsibility.
- Do not use High/Critical work share as the definition of Human Intensity.
- Do not create a second Human Criticality rating that can disagree with Consequence of Error.
- Do not automate scoring or polish the dashboard until the manual evidence logic survives all three pilots.

14. Immediate Next Steps

1. Send Timothy the consolidated response on the four work-side proposals and confirm the refinements in this draft.
2. Use this v0.2 structure as the working instrument for Recruiter Test 2 without changing the ten dimensions.
3. Record finding, evidence, gap, required action, owner and what-would-move-it for every Recruiter dimension.
4. Run CHRO Test 3 using the same instrument and the Governance/Oversight Body variant.
5. Compare the three pilots side by side before declaring any dimension a universal hard gate.
6. Finalize GR-013 Human Agency and the v0.2 hard-gate logic only after the comparison is complete.
7. Freeze what held; revise only what the evidence challenged; then decide what should be built into the sandbox.

15. Consolidated Note to Timothy

Tim - I worked through the GR-012 v0.2 issues and pulled them into one working specification so we have a single place to pressure-test the human-readiness logic. I am keeping the ten dimensions, but making the role/human, organizational and shared-evidence layers explicit. I also want the four finding states - Ready, Conditional, Not Ready and Insufficient Evidence - to be evidence-driven, with Gray remaining a legitimate outcome when organization-specific proof is missing.

I am aligned with the four work-side proposals with a few refinements: Human Intensity stays qualitative and the High/Critical share is an input rather than its definition; weakest-link applies to materially required operational roles on High/Critical work while governance/oversight stays a separate readiness condition; the top-of-catalog case should use an evidence-based Governance/Oversight Body variant; and Human Criticality should interpret the existing Consequence of Error evidence rather than create a second rating.

For GR-013, I want Human Agency to remain distinct because human presence is not the same as meaningful control, but I do not want it to become an eleventh readiness dimension or another score. It should be a derived finding that answers whether the person can actually exercise the judgment and accountability the model leaves with them.

The next step on my side is to run the same v0.2 instrument through Recruiter and CHRO without redefining the dimensions, then use those three pilots to decide which dimensions truly behave as hard gates and what should be built into the sandbox. My goal is still the same: a reusable operating-readiness instrument that produces defensible, evidence-backed findings rather than another scorecard.

16. Working Basis

This draft consolidates GiGi Garcia's GR-012 Human Operating Readiness working notes, the Human Impact & Readiness workstream update, the Working-Relationship Progression methodology, the completed HRBP grievance pressure test, and the October work-side proposals reviewed for GR-012 v0.2. It is intended as a working specification for joint discussion with Timothy King, not as a claim that every open construct is already implemented.

17. v0.2 Change Summary

- Keeps the original ten dimensions but makes the Role/Human, Organizational and Shared Evidence layers explicit.
- Replaces unsupported Yellow assumptions with Gray / Insufficient Evidence until organization-specific proof exists.
- Strengthens the evidence record so every finding carries provenance, a gap, an owner and a clear "what would move this finding" statement.
- Keeps hard gates as candidates until the same instrument is tested across HRBP Manager, Recruiter and CHRO.
- Integrates refined positions on Human Intensity, weakest-link behavior, the Governance/Oversight Body variant and Human Criticality.
- Defines Human Agency as a distinct derived finding without creating an eleventh readiness dimension or another score.
- Requires a narrative conclusion instead of a composite readiness percentage.

18. Items for Joint Confirmation with Timothy King

- Confirm agreement on the four work-side proposal refinements in Section 8.
- Confirm "Governance/Oversight Body" as the top-of-catalog naming convention, or agree a final alternative that does not conflict with the Working Relationship category "Oversight."
- Confirm that the Recruiter and CHRO human-readiness pilots will use the same ten dimensions without modification.
- Confirm that candidate hard gates remain provisional until the three-pilot comparison is complete.
- Confirm the evidence fields that the sandbox should eventually retain for each GR-012 finding.
