

TO TIMOTHY KING

Why I Felt Compelled to Share This Report

My perspective on the LifeLabs Learning 2026 Mid-Year Workplace Trends Report

Tim - I felt compelled to share this because the report puts independent evidence around the problem we have been trying to solve: AI is moving faster than the organizations, managers, roles, and decision systems expected to absorb it.

What struck me most is that this is not really a report about technology. It is a report about organizational readiness. LifeLabs found that 58% of respondents described AI adoption as improvised, while only 14% called it thoughtful and coordinated. The same report connects that improvisation to unclear ownership, manager overload, fragmented focus, weakened trust, and inconsistent accountability (pp. 15-21). Those are not separate problems. They are the conditions that determine whether AI creates value or simply accelerates confusion.

Why it validates our direction

Our work is positioned precisely in the gap between AI strategy and the lived operating reality of an organization. The role taxonomy, transition profiles, readiness dimensions, RACI and data views we have discussed can help leaders answer a more consequential question than "Where can we use AI?": Where is the organization actually ready for AI, and where would deployment make accountability, workload, or decision-making worse?

Questions I believe we should bring forward

- 01** Are we mapping jobs, or the full system of work - tasks, handoffs, decisions, dependencies, exceptions, and accountability?
- 02** Can the model identify where not to deploy AI yet because role clarity, manager capacity, trust, workflow maturity, or change capacity is too weak?
- 03** Can we measure readiness debt and manager complexity load, then prescribe the intervention - not merely display the risk?

Why I wanted you to see it

The report did not make me think we should change direction. It made me think we should widen our ambition. We may not simply be building an AI workforce-readiness assessment; we may be building the organizational architecture layer that shows how work, decisions, people, and accountability must operate together in an AI-enabled organization. That is what could make this cutting edge, difficult to replicate, and invaluable to leaders.

My guiding principle remains: *AI can redistribute work. It cannot redistribute accountability.*
