

Role-Specific Pattern Transitions

What M1 → M3 → M5 actually means for the work — stage-first view, HRBP Manager

The treemap exhibits show how the composition of each role's remaining human work shifts as AI matures, organized by **maturity stage first, pattern second** — the same M1/M3/M5 column structure as the treemap itself. This view answers: at this specific stage, across every pattern the role touches, what does the work actually look like? Note that two different percentages appear below: the treemap's box size is each pattern's share of the total remaining workload at that stage (the boxes in each column sum to 100%), while the percentage next to each pattern in the stage detail is that pattern's own human-involvement level, independent of the others.

HRBP Manager

Accountable on 22 real L4 activities across 10 real Accountable processes (7.2.1 Manage requisitions, 7.3.2 Manage performance, 7.4.1 Labor relations, 7.4.2 Collective bargaining, 7.4.3 Labor-management partnerships, 7.4.4 Employee grievances, 7.6.1 Promotion/demotion, 7.6.2 Manage separation, 7.8.1 Communication plan, 7.8.3 Deliver communications). Excludes 7.6.3 (Relocate employees), flagged in the source data as a partial/gap-noted accountability.

HRBP Manager's remaining human work concentrates in judgment and exception-handling as AI matures: Decision's share nearly doubles, Exception holds firm, and Transaction fades toward the margins.

Composition of HRBP Manager's real activity mix still requiring human involvement, by HITL pattern — area = share, %

M1 — Undesigned

M3 — HITL Design Intent
Target state

M5 — Leading
Future state

Built from HRBP Manager's real PCF 7.0 RACI data (hitl_dashboard_final.html) — 22 activities across its 10 real Accountable processes (7.2.1 Manage requisitions, 7.3.2 Manage performance, 7.4.1 Labor relations, 7.4.2 Collective bargaining, 7.4.3 Labor-management partnerships, 7.4.4 Employee grievances, 7.6.1 Promotion/demotion, 7.6.2 Manage separation, 7.8.1 Communication plan, 7.8.3 Deliver communications), weighted by activity count × each pattern's M1/M3/M5 human-involvement %. Excludes 7.6.3 (Relocate employees), flagged in the source data as a partial/gap-noted accountability. Layout: squarified treemap (Bruls/Huizing/van Wijk), each column laid out independently from its own sorted values — box area is the only encoded quantity, position and aspect ratio are layout artifacts.

M1 — Undesigned

(Current state)

KNOWLEDGE · 85% human involvement

Building labor-relations strategy, negotiating collective bargaining positions, sustaining labor-management partnerships, and designing performance-management approaches — this is relationship-and-judgment work the HRBP Manager owns personally, with essentially no structured AI support underneath it at this stage.

TRANSACTION · 60% human involvement

Managing requisitions and delivering communications — at this stage the HRBP Manager is personally handling requisition paperwork and pushing communications out by hand.

DECISION · 92% human involvement

Deciding who gets promoted or separated, and how a grievance resolves — at this stage the HRBP Manager owns these calls almost entirely on personal judgment, with no structured AI input underneath them.

DOCUMENT · 72% human involvement

Drafting the communication plan itself — largely manual writing work at this stage.

EXCEPTION · 95% human involvement

The rare case that falls outside every normal process — a labor dispute that escalates, a grievance that doesn't resolve through standard channels — is handled almost entirely on the HRBP Manager's own judgment, since nothing structured yet exists to support it.

M3 — HITL Design Intent

(Target state)

KNOWLEDGE · 65% human involvement

AI can surface bargaining-history patterns, grievance-trend data, and performance benchmarks, but the relationship work itself — building trust with labor representatives, reading a bargaining session, deciding how hard to push a position — stays with the HRBP Manager. AI narrows the research burden underneath the judgment, not the judgment itself.

TRANSACTION · 35% human involvement

Most of this is now templated and system-driven — requisition routing, communication delivery — with the HRBP Manager mainly handling exceptions the system flags.

DECISION · 80% human involvement

AI can surface comparable-case data — prior promotion decisions, grievance-resolution precedent, performance history — but the actual call on promotion, separation, and grievance outcomes stays human. A wrong call here carries real legal and trust cost, which is why the framework keeps this pattern close to full human ownership even at design intent.

DOCUMENT · 40% human involvement

Most of the plan's language now auto-generates from approved talking points and prior-plan templates, with the HRBP Manager reviewing and tailoring rather than drafting from scratch.

EXCEPTION · 82% human involvement

AI can flag that a case doesn't fit the normal pattern and surface comparable past exceptions, but resolving it is still squarely human — Exception-pattern work resists structuring by design.

M5 — Leading

(Future state)

KNOWLEDGE · 42% human involvement

AI-assisted analysis of labor and performance trends is the default; the HRBP Manager's value narrows to what a system can't do — building trust across a bargaining table, sensing a partnership fraying before the data shows it.

TRANSACTION · 12% human involvement

This work is a rounding error at this stage: reserved for the rare case the process genuinely breaks — the pattern that shrinks fastest and furthest across every role in the framework.

DECISION · 65% human involvement

Even at the framework's most mature state, most of the call on someone's career or employment status is still human — comparable to Decision's floor in other roles, and for the same reason: this is accountability that can't be delegated to a system.

DOCUMENT · 18% human involvement

Nearly fully automated: the HRBP Manager's role becomes a final check that tone and specifics match what leadership actually intends to communicate.

EXCEPTION · 68% human involvement

Even at the framework's most mature state, Exception-pattern work stays close to fully human — the floor barely moves, consistent with the framework's broader point that Decision and Exception are the two patterns that resist automation longest.

Source: hitl_dashboard_final.html, PCF 7.2–7.8 (real RACI/pattern data) — matches hrbp_manager_treemap_mckinsey.html (pattern-first companion view) and rtp_hrbp_manager.html.

Note: unlike the Recruiter stage-first view, this exhibit does not cite specific Governed Decision Point escalation targets for Decision-pattern work — that level of detail isn't yet confirmed against the live dashboard for this role, so it's left out rather than assumed.
