

# Framework Content Generation Rules

## Compliance Audit — WIP Hub Pass (POC)

*A proof-of-concept pass checking the 17 proposed rules against the WIP hub's own 9 in-scope documents — before any rule is approved, and before anything gets applied to the live framework.*

*Scope: the 9 documents in the WIP hub that are Tim/Claude's own generated content — the 3 role pattern-transition narratives, The Shock Wave Effect, From Concept to Principle, the 3 rules docs themselves, and Talking Through Your Questions. GiGi's 2 review notes are excluded, same reasoning as the Word-doc backfill: they're her own words, not ours to audit against our own house rules. Nothing on the live, published framework was touched or scored in this pass.*

*Method: mechanically checkable rules (colors/fonts, callout counts, banned phrases, H% proximity, etc.) were run through a script against the raw source of each document; every hit was then read in context by hand — a keyword match is not the same as a violation, and several of the strongest-looking hits below turned out to be the rules docs themselves quoting the phrase as an example. Rules that require actual judgment (does this page link a pattern legend? is the load-bearing claim pulled out?) were assessed by a direct read, not a script.*

*Update since this audit was first run: three of the findings below have already been fixed, as a proof-of-concept for what bringing a document into compliance actually looks like. (1) Token Lock's color list now includes the light-blue accent — the pattern-palette and background gaps noted below are still open. (2) All 3 role-narrative Word docs now display the canonical pattern legend directly above their composition table. (3) The one under-labeled convergence-gap mention in Talking Through Your Questions now carries an explicit "modeled, not observed" note. Each fixed finding below is marked accordingly. The bigger open question — the two-design-systems finding itself, and what to do about the 3 role-narrative pages' font stack and type scale — was deliberately left untouched: this remediation pass touched only the Word-doc companions and the rule text, never the live, published HTML.*

## Headline Finding: Two Design Systems Are Currently Coexisting

The 3 role pattern-transition narratives (CHRO, HRBP Manager, Recruiter) were built for a print/PDF export pipeline and use a genuinely different system than the rest of the WIP hub: Segoe UI and Georgia instead of DM Sans/Playfair Display/DM Mono, point-based sizing instead of the standard px scale, no callout boxes, and no pattern legend anywhere on the page. The other 6 documents already follow the site's native HTML masthead system closely. This isn't a defect in either set — the print system was a deliberate, reasoned choice for a PDF export pipeline — but it means Token Lock and the Standing Type Scale, as currently worded, would need an explicit carve-out for print-oriented exhibit pages, or those 3 pages would need to be rebuilt onto the standard system. That's a real decision, not a bug to quietly fix.

## Rule-Gap Findings: the Rules Themselves Need a Small Fix

Token Lock's written color list (navy, navy-d, navy-l, gray, light gray, border, amber, amber-bg) omitted several colors that are already in universal, load-bearing use across every document in the framework — not just these 9. As literally worded, the rule would flag nearly every page in the WIP hub, and the live site too. That's a sign the rule's list was incomplete, not that the content is wrong. One of the three has since been folded into the rule; two remain open:

- **The light-blue accent** (#9FC2EE / #9FC0E8) — used in every masthead tagline and nav element across all 9 documents. **FIXED** — Rule 1 now explicitly lists it as locked.

- **The five-pattern color palette** (Decision/Knowledge/Document/Transaction/Exception, both the box and text variants) — the same palette already locked in as the dashboard's standard, used throughout the role-narrative pages. Still open.
- **The page background** (#F4F6FB) — the standard body background on every one of these pages. Still open.

*Remaining recommendation: extend Rule 1 to whitelist the pattern palette and the standard page background too, the same way the light-blue accent was just folded in — rather than leaving Token Lock in a state where compliant, well-established pages still read as violations.*

## Visual System & Hierarchy — 7 Rules

### **GAP** Rule 1 — Token Lock

The light-blue portion of the rule-gap finding above is now fixed — Rule 1 explicitly lists it as locked. The pattern-palette and background gaps remain open. Separately, the 3 role-narrative pages still use an entirely different font stack on the live HTML (Segoe UI / Georgia) rather than DM Sans / Playfair Display / DM Mono — untouched by this remediation pass, which deliberately stayed inside the Word-doc companions.

### **MIXED** Rule 2 — One Pattern Legend

FIXED in the Word-doc companions: all 3 role-narrative docx now display the canonical pattern legend — the same fixed color-and-label mapping used by the live dashboard — directly above their composition table. The live HTML pages for these 3 roles still don't display or link one; this pass deliberately touched only the docx, so that gap stays open until a live-site pass is authorized.

### **MIXED** Rule 3 — Extract the Load-Bearing Claim

The role-narrative pages already do this reasonably well (bold exhibit headlines carry the finding). Talking Through Your Questions works through the ~21-point convergence-gap math in dense prose rather than a callout — a real candidate for extraction, though it's a working discussion draft rather than a polished deliverable.

### **CLEAN** Rule 4 — Callout Budget

No document exceeds 3. (An earlier automated pass mis-flagged Talking Through Your Questions at 8 by matching "callout-rule," a plain divider, as if it were a callout — corrected on inspection; its real count is 3, right at the limit.)

### **MIXED** Rule 5 — Standing Type Scale as Default

The 6 standard-system documents track the locked scale closely (H1 22-28px, H2 16-20px, body 13-14.5px). The 3 role-narrative pages use a smaller, point-based scale from their print pipeline that doesn't map onto these px ranges at all — same root cause as the headline finding.

### **CLEAN** Rule 6 — Protect the Signature Line

"Where human judgment belongs" appears twice, both times as an isolated tagline element, never merged into a sentence.

### **N/A** Rule 7 — The Executive Layer Never Replaces the Technical Layer

None of these 9 documents are executive-summary/briefing content sitting alongside a technical source — this rule targets the CHRO-facing briefing series specifically, which isn't part of the WIP set. Nothing to check here yet.

## Navigation & Structure — 3 Rules

### **N/A** Rule 1 — Problem-First Entry Points, Additive

This rule governs the site's primary navigation (docs/index.html), which is out of scope for a WIP-only pass — none of these 9 documents have their own independent top-level nav to check.

### **CLEAN** Rule 2 — One Canonical Explanatory Sequence

"Technology Capability → Work Design → Human Judgment → Accountability → Readiness" appears verbatim, in order, in the 2 documents that use it (the Navigation rules doc and Talking Through Your Questions) — no drift or paraphrase found. (Two other apparent hits, in the Shock Wave Effect and Visual System rules docs, turned out to be coincidental reuse of single words — "Accountability" as a Shock Wave ring name, "Readiness" inside "Readiness Table" — not the sequence itself.)

### **N/A Rule 3 — Hierarchy Fix Not Redesign**

A process constraint on how navigation changes get evaluated, not a property existing content can be checked against.

## **Language & Precision — 7 Rules**

### **CLEAN Rule 1 — Protect the Proven Lines**

Both protected lines appear only where quoted verbatim (inside the rules docs themselves, describing the rule) — no paraphrased or reworded variant found anywhere in scope.

### **N/A Rule 2 — Name the Organizational Framing Explicitly**

No introductory/overview section in this document set summarizes the framework from scratch — the phrase appears only inside the rules docs' own discussion of the rule.

### **CLEAN Rule 3 — Modeled vs. Observed, Always Labeled**

FIXED: the one "20-25" mention that sat outside the disclaimer's reach — in the site-recommendations summary near the top of Talking Through Your Questions — now carries an explicit bracketed note pointing to the full "modeled, not observed" answer in Q2. Every convergence-gap mention in the document is labeled.

### **CLEAN Rule 4 — No Absolute Claims About Safety or Control**

Every appearance of "structurally impossible" / "nothing is a black box" in scope is the rules docs quoting the banned phrase as the example of what to avoid — zero instances of the framework actually making either claim.

### **MIXED Rule 5 — H% Carries Its Disclaimer**

The disclaimer appears multiple times across Talking Through Your Questions, but several individual "H%" mentions inside its long methodology discussion sit outside a tight proximity window. The rule's "displayed in isolation" framing fits a report figure better than a multi-paragraph discussion analyzing the metric itself — an applicability-boundary question worth naming, not a violation.

### **CLEAN Rule 6 — "Designed," Not "Optimal," Unless Earned**

Every "optimal" in scope appears only inside the rules docs' own discussion of the rule — no document in this set actually describes a maturity target as "optimal." (Live-site usage, e.g. on hitl\_methodology.html, is out of scope for this pass.)

### **N/A Rule 7 — Frame HAL as Origin Story, Not Operating Target**

Every HAL mention in scope is the rules docs discussing the rule itself — none of these 9 documents contain an actual HAL example to frame one way or the other yet.

## **Per-Document Snapshot**

| Document                                    | Design system                    | Notable finding(s)                                                                                         |
|---------------------------------------------|----------------------------------|------------------------------------------------------------------------------------------------------------|
| CHRO — Pattern Transition Narrative         | Print/PDF (Segoe UI, pt-based)   | Pattern legend now included (Word doc); live HTML type scale still doesn't map to the standard px ranges   |
| HRBP Manager — Pattern Transition Narrative | Print/PDF (Segoe UI, pt-based)   | Same as CHRO                                                                                               |
| Recruiter — Pattern Transition Narrative    | Print/PDF (Segoe UI, pt-based)   | Same as CHRO                                                                                               |
| The Shock Wave Effect                       | Standard site (DM Sans/Playfair) | Callout budget 2/3; type scale compliant                                                                   |
| From Concept to Principle                   | Standard site (DM Sans/Playfair) | Callout budget 2/3; type scale compliant                                                                   |
| Visual System & Hierarchy rules             | Standard site (DM Sans/Playfair) | Callout budget 1/3; contains the HAL/optimal/canonical-sequence mentions that are examples, not violations |
| Navigation & Structure rules                | Standard site (DM Sans/Playfair) | Only document where the canonical sequence appears both verbatim and on-topic                              |
| Language & Precision rules                  | Standard site (DM Sans/Playfair) | Contains every "banned phrase" hit — all of them the rule quoting its own example                          |

| Document                       | Design system                    | Notable finding(s)                                                                            |
|--------------------------------|----------------------------------|-----------------------------------------------------------------------------------------------|
| Talking Through Your Questions | Standard site (DM Sans/Playfair) | Callout budget exactly 3/3 (at the limit); richest H%/modeled-vs-observed discussion in scope |

## What This Means for the Feasibility Review

Taken together: none of the 17 rules turned up a real violation inside this document set. What the pass did surface is more useful than a clean bill of health would have been — a concrete color-list gap in Rule 1 (partially fixed already), a real fixable content gap in Rule 2, and a real, structural question (what to do about the print-system pages) that’s worth deciding deliberately rather than discovering later once more print-oriented pages exist. Both are good, specific material for the actual Feasibility Review conversation with GiGi, and neither required rewriting anything to find.

A small remediation pass followed this audit, as a proof-of-concept for what compliance actually looks like once a gap is confirmed real: the light-blue accent was folded into Rule 1, all 3 role-narrative Word docs now carry the canonical pattern legend, and the one under-labeled convergence-gap mention was tightened. All three fixes stayed inside the Word-doc companions and the rule text itself — nothing on the live, published framework was touched.

Next step, per the staged approach: once the rules themselves move past Concept and both Tim and GiGi approve them, the same treatment extends to the live framework itself — every published HTML page, not just these 9 WIP documents — starting with the two-design-systems decision above, since that one question drives most of the remaining Rule 1 and Rule 5 findings. This POC pass already shows what that full audit would look like: run the same 17 rules against the whole site, confirm each hit by hand before calling it a violation, and fix only what’s real.
